

ABSTRACT OF THE DISCLOSURE

5 A spa cover remover has a pair of lifting arms at opposite sides of a spa housing, and supports pivotally connected to lower ends of the lifting arms to allow pivotation of the lifting arms for raising and folding a spa cover remover. The pivotation of the lifting arms is facilitated by tension springs, which are connected to the lower ends of the lifting arms, and which are accommodated within housings, so that the springs are enclosed and concealed by the housings and thereby protected from the elements and from risk of damaging the clothing or body of a person operating the spa cover remover.
